Lesya Merdukh

- Deepen and broaden children's knowledge about the impact of humans on nature. Bring the children to realize the need to preserve and promote natural resources rationally use them.
- Develop: cognitive interest, cognitive activity; language; observation; creative abilities of students; ability to find, analyze, organize information and use it; ability to work in a group.
- Train heed economic relationship to nature, as his home, the desire to save the planet Earth for future generations, love of nature, environmental literacy and awareness that the Earth - our common home.

# **Topicality**

Environmental protection has become one of the most difficult

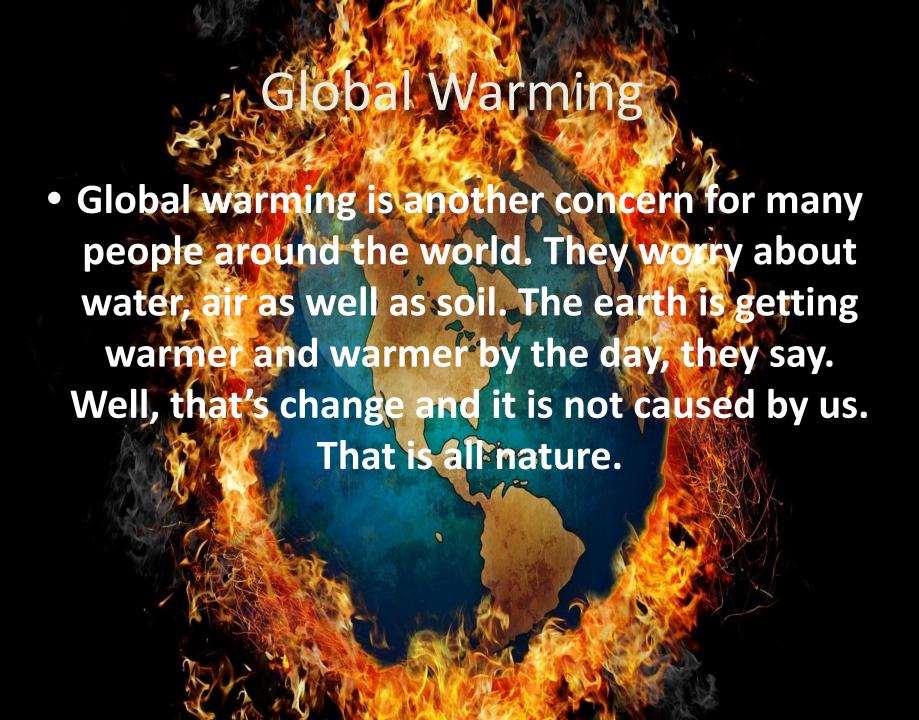

problems 20 centuries. Our planet gives people the natural resources, rivers, forests, fields that is the basis of all industrial and agricultural production.

Industrial development is bad for the whole nature of our world. Industry people are often very polluting land and water. This is very dangerous

because it is harmful to health.

#### The Earth Is In Danger

The Earth is our home. It gives us everything: food, clothes and houses. But our earth is in danger because people don't care of it. We want to see blue seas, green trees that are why we must protect our Earth.

# Saving the Endangered Species

ow how many times have we heard humans yelp about saving species that are declining with each passing day? you add sensitivity to the issue, the discussion might see fair and many people would join hands for the caus However, if you think logically, it is just another attempt by humans to exhibit their controlling behaviour. Humans are trying to control nature, which is meddling with natura occurrences, and that can be dangerous. Statistically, since life began on earth, 90% of species that have existed have disappeared and humans are not responsible for their disappearance. Nature took its course; that's what happened. Save the trees, save the tigers, save the whales its evolution and we need to accept the change.

### Soil erosion

Soil erosion - is the destruction of his upper horizon and fertile ground by natural and anthropogenic factors (mechanical destruction of its kinetic action of water (flow of shots and drops) or wind flows).

## Forest-the lungs of a planet

In all countries in every corner of the world held massive eforestation. The problems of the forest that the destruction of rees killed many more species of plants and animals. Violated ecological balance in nature. After the forest - it's not just the trees. This harmonious ecosystem, based on the interaction of many species of flora and fauna. In trees, the importance of its existence shrubs, grasses, lichens, insects, animals and even bacteria. Despite massive deforestation, forests still cover about 30% of the land. This is more than 4 billion hectares of land. More than half of them - a tropical forest. However, important in the ecology of the planet and also played the North, especially conifers arrays. Green richest country in the world - is Finland and Canada. In Russia, are about 25% of world reserves of forest. The smallest trees left in Europe. Now forests cover only a third of its territory, but in ancient times it was completely covered with trees. And, for example, in England it is almost gone, only 6% of the land given to the park and forest plantations.

### Ozone hole

The weakening of the ozone layer increases the flux of solar radiation on the ground and causing people increasing number of skin cancers. Also, elevated levels of radiation affected plants and animals.
