- Одной из основных и простейших фигур в геометрии является четырехугольник.
- За несколько тысячелетий геометры так подробно изучили четырехугольник, что иногда говорят о «геометрии четырехугольника» как о самостоятельном разделе геометрии.

Доказательство теоремы о диагоналях прямоугольника.

Дано: ABCD - прямоугольник,
AC и DB – диагонали.

Доказать: $AC=BD$.

Доказательство

Рассмотрим $\triangle CDA$ и $\triangle BAD$:

1. AD – общая,
2. $CD = BA$ – противоположные стороны прямоугольника,
3. $\angle CDA = \angle BAD$ (по 90°), значит $\triangle CDA = \triangle BAD$.

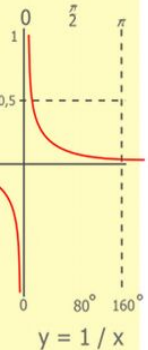

Из равенства треугольников следует равенство его соответствующих сторон,

значит $AC=BD$.

Теорема: Диагонали ромба пересекаются под прямыми углами и являются биссектрисами его углов.

Дано: ABCD - ромб,
AC и BD – диагонали,
 $AC \cap BD = O$.

Доказать 1) $AC \perp BD$,

2) AC и BD – биссектрисы углов ромба.

Доказательство

$\triangle ABC$ – равнобедренный с основанием AC,

O – середина AC (как точка пересечения диагоналей параллелограмма),
тогда BO – медиана, значит BO – высота, и биссектриса.

Получили: 1) $AC \perp BD$; 2) BD – биссектриса угла B.

Аналогично доказывается, что BD – биссектриса угла D

и AC – биссектриса углов A и C.
