

#### 9-10 НОЯБРЯ 2011 МОСКВА

Providing Broad Access to Data with OData

David Chappell
Principal
Chappell & Associates

Microsoft\*

### Agenda

Describing OData: The Basics

Examining OData: A Closer Look at the Technology

# The Problem: Accessing Diverse Data

- Many kinds of data sources exist, such as:
  - Custom apps with relational storage
  - Cloud platforms with relational storage, NOSQL storage, etc.
  - · Content management systems with lists, etc.
- Many kinds of clients can use data, such as:
  - Web browsers
  - Phone/tablet apps
  - Business intelligence (BI) tools
  - Custom apps
- How can all of these clients access all of these data sources?

### A Solution: OData

- The Open Data Protocol (OData) addresses this problem
  - It lets diverse clients access diverse data sources
- OData defines:
  - An abstract data model
  - A standard access protocol
    - With multiple data serialization formats
- OData is a generic technology
  - It's not tied to Windows
  - Although Microsoft provides tools and libraries for implementing OData

### Illustrating OData

**Clients** 

Web Browsers (Internet Explorer, Firefox, ...)

Mobile Phones (Android, iPhone, Windows Phone 7)

BI Tools (Microsoft Excel, Tableau Desktop)

Custom Applications (.NET, Java, PHP, ...)

**OData** 

**Data Sources** 

Custom Applications (.NET, Java)

Cloud Storage (Windows Azure Tables, SQL Azure)

Content Management (SharePoint 2010, Webnodes)

Windows Azure
Marketplace
Data

. . .

## OData Components (1)

- The OData data model
  - Provides a generic way to organize and describe data
  - Uses the Entity Data Model (EDM) from Microsoft's Entity Framework

- The OData protocol
  - Based on HTTP
  - Lets a client make requests to and get responses from an OData service

# OData Components (2)

- An OData service
  - Exposes an endpoint that allows access to data
  - Uses the abstractions of the OData data model to translate data between its underlying form (e.g., relational tables) into the format sent to the client

- OData client libraries
  - Make it easier to create software that accesses data via the OData protocol

#### Exposing Data from a Cloud Application An OData scenario

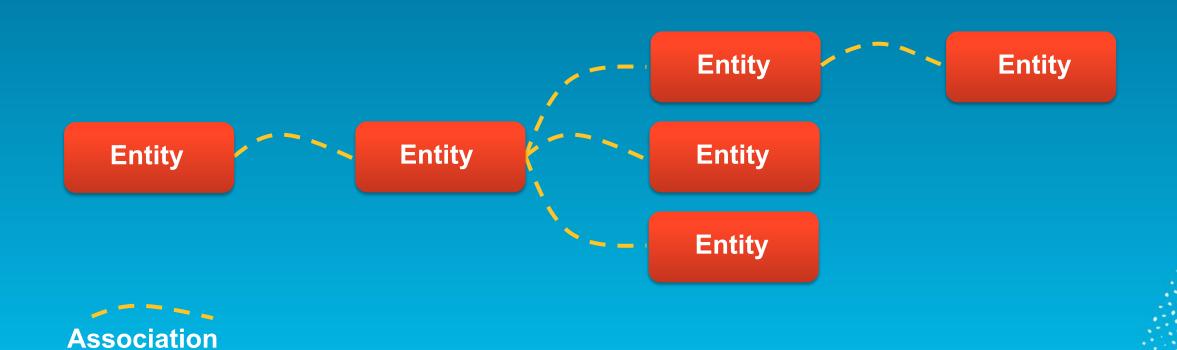

#### Using Diverse Data Sources with BI Tools An OData scenario

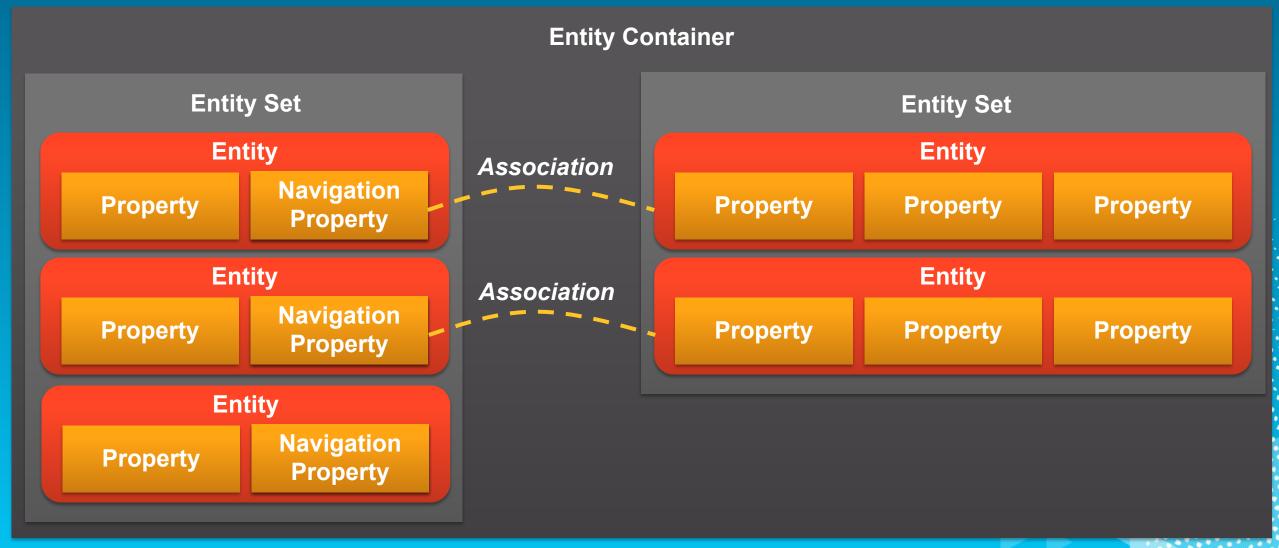

# The OData Data Model Entities and associations in the EDM

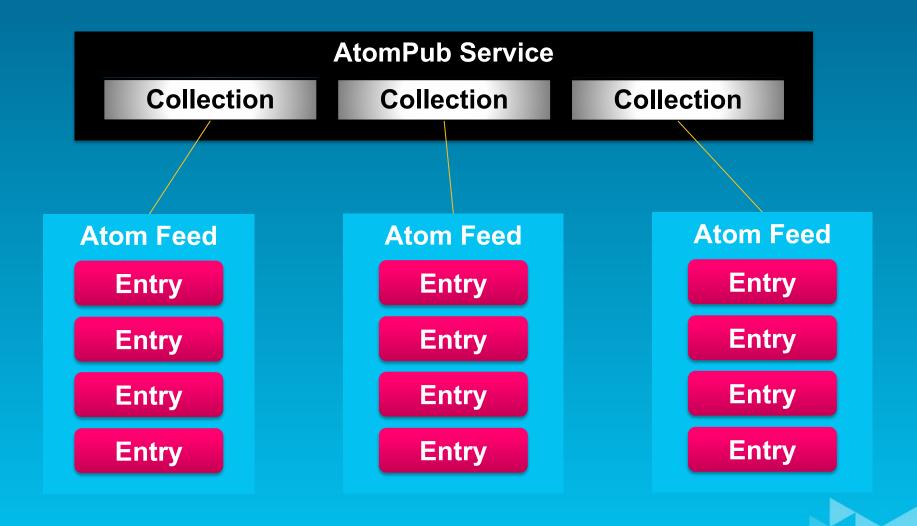

# The OData Data Model A closer look at the EDM

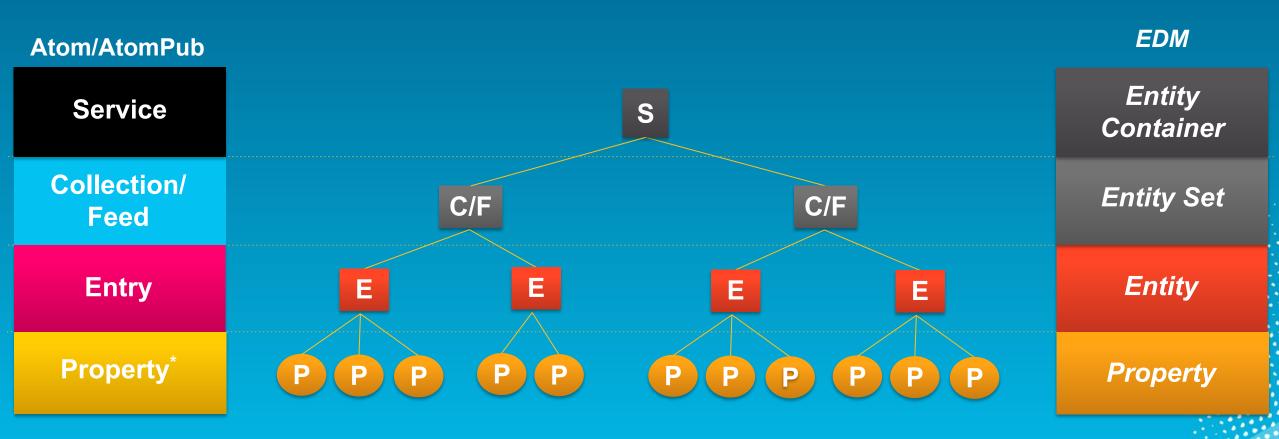

#### Basics

- Based on HTTP
- Example verbs:
  - POST: Creates a new entity
  - GET: Reads data from one or more entities
  - PUT: Updates an existing entity, replacing all of its properties
  - DELETE: Removes an entity
  - MERGE: Updates an existing entity, but replaces only specified properties
- Supported serialization options:
  - XML-based Atom/AtomPub
  - JavaScript Object Notation (JSON)

# The OData Protocol \*\*Illustrating Atom and AtomPub\*\*

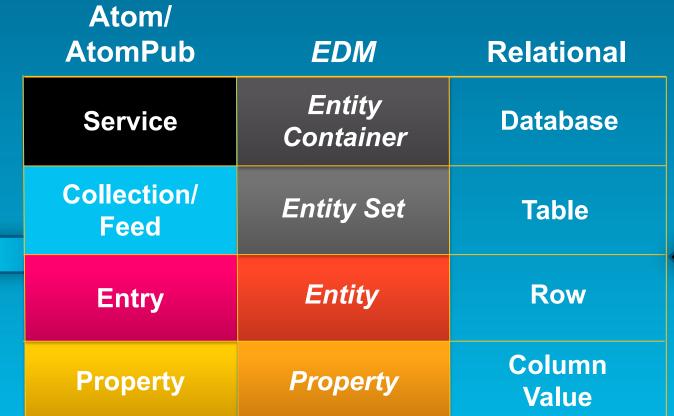

# The OData Protocol Mapping between EDM and Atom/AtomPub

<sup>\*</sup>OData-defined extension to Atom

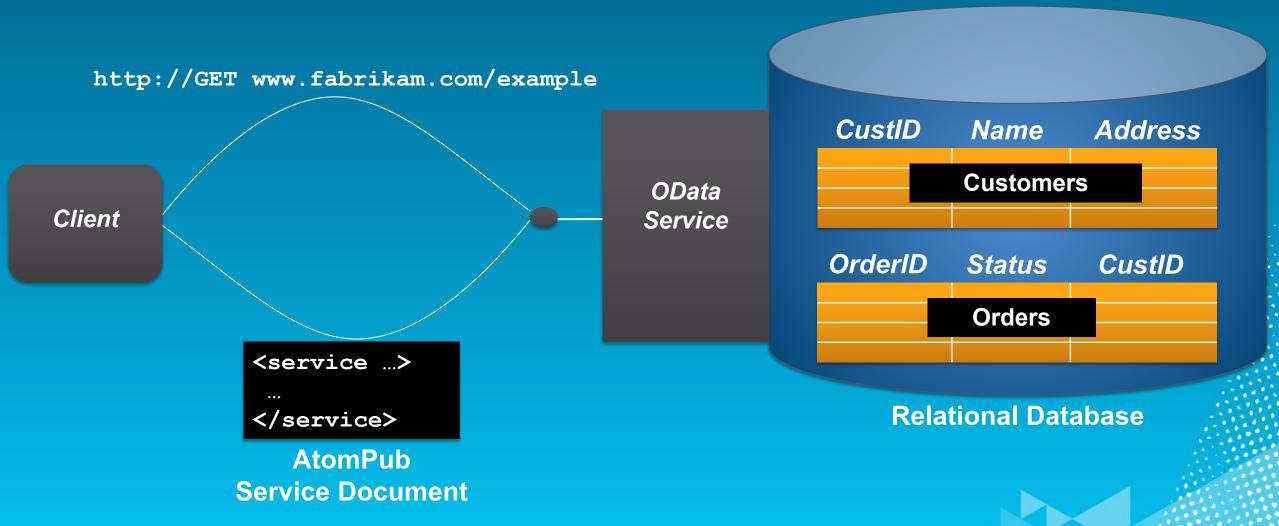

Serializing relational data in Atom/AtomPub

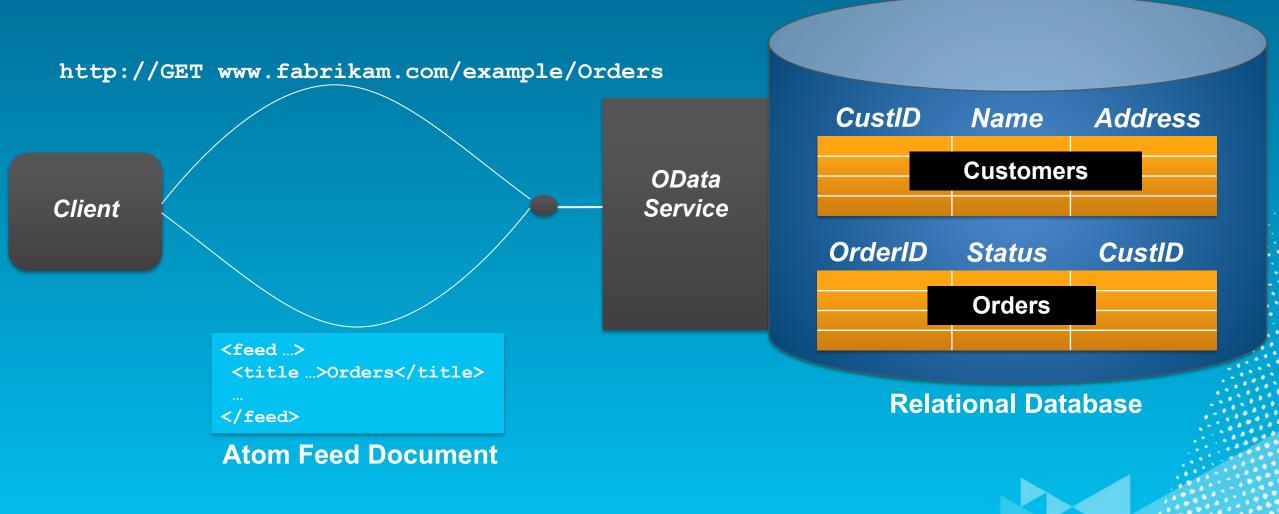

# The OData Protocol Getting an AtomPub service document

An example AtomPub service document

```
<service ...>
  <collection href="Customers">
    <atom:title>Customers</atom:title>
  </collection>
  <collection href="Orders">
    <atom:title>Orders</atom:title>
  </collection>
</service>
```

# The OData Protocol Getting an Atom feed document

An example Atom feed document (1)

```
<feed xmlns:m= ... xmlns:d= ... >
  <title type="text">Orders</title>
                     An OData-defined extension to Atom/AtomPub
  <entry>
    <content type="application/xml">
      <m:properties>
        <d:OrderID m:type="Edm.Int32">3501</OrderID>
        <d:Status>Shipped</Status>
        <d:CustID m:type="Edm.Int32">867734</CustID>
      </m:properties>
    </content>
  </entry>
                            An Entity Data Model-defined data type
```

feed>

An example Atom feed document (2)

```
<entry>
  <content type="application/xml">
   <m:properties>
     <d:OrderID m:type="Edm.Int32">5630</OrderID>
     <d:Status>Placed</Status>
     <d:CustID m:type="Edm.Int32">8499734
   </m:properties>
  </content>
</entry>
<entry>
</entry>
```

# The OData Protocol Some other options

Returning the number of entries in a feed:

```
http://GET www.fabrikam.com/example/Orders/$count
```

Returning only the entry whose primary key is 5630:

```
http://GET www.fabrikam.com/example/Orders(5630)
```

Serializing data with JSON

The first request:

```
http://GET www.fabrikam.com/example
```

The response:

```
{ "d" : {
   "EntitySets": ["Customers", "Orders"]
} }
```

Serializing data with JSON

Requesting data:

```
GET http://www.fabrikam.com/example/Orders(5630)
```

The response:

```
{ "d" : {
    "results": {
        "OrderID": 5630,
        "Status": "Placed",
        "CustID": 8499734 }
}
```

Issuing queries (1)

The OData query language is expressed as options appended to a GET request

#### Examples:

- \$top=n: Returns only the first *n* entities in an entity set
  - That is, the first *n* entries in an Atom feed
- \$skip=n: Skips the first *n* entities in an entity set
  - Lets a client retrieve a series of distinct pages on subsequent requests
- \$format: Determines whether data should be returned in JSON or Atom/AtomPub
  - Default is Atom/AtomPub

Issuing queries (2)

- Expressions:
  - \$orderby=<expression>: Orders results by the value of one or more properties in those results
  - \$filter=<expression>: Returns only entities that match the specified expression
  - \$select=<expression>: Returns only the specified properties in an entity

#### Example:

```
http://GET www.fabrikam.com/example/Orders?$filter=OrderID gt 3000 and OrderID lt 5000
```

# Implementing OData What Microsoft provides

WCF Data Services
Client Libraries

.NET OData Client Library

> Silverlight OData Client Library

Windows Phone 7
OData Client
Library

. .

WCF Data Services Framework

Data

Services

Runtime

OData Protocol Layer

Entity Framework Provider

Data Access

Reflection Provider

Custom Provider Relational Data

#### Conclusion

- OData provides broad support for accessing many kinds of data
- It includes:
  - A general data model
  - A protocol
    - With serialization in Atom/AtomPub or JSON
- Microsoft also provide support for implementing OData clients and services

OData addresses an important problem

#### Feedback

Dear attendees!

Your feedback is appreciated!

In notepad that can be found in attendee's infopack, you will find a feedback form

Please, rate the session and pass the feedback form to the moderator on exit

To take part in a lottery, please do not forget to mark the feedback form with the number of your badge

Thank you!

### About the Speaker

David Chappell is Principal of Chappell & Associates (www.davidchappell.com) in San Francisco, California. Through his speaking, writing, and consulting, he helps people around the world understand, use, and make better decisions about new technology. David has been the keynote speaker for more than a hundred events and conferences on five continents, and his seminars have been attended by tens of thousands of IT decision makers, architects, and developers in forty countries. His books have been published in a dozen languages and used regularly in courses at MIT, ETH Zurich, and other universities. In his consulting practice, he has helped clients such as Hewlett-Packard, IBM, Microsoft, Stanford University, and Target Corporation adopt new technologies, market new products, train their sales staffs, and create business plans. Earlier in his career, David wrote networking software, chaired a U.S. national standards working group, and played keyboards with the Peabody-award-winning Children's Radio Theater. He holds a B.S. in Economics and an M.S. in Computer Science, both from the University of Wisconsin-Madison.
